DocMate Sample Report

This PDF exists so the reader can be checked end to end: pdf.js must render the page, and the text layer must let a reader select a sentence with the mouse.

1. Background

A companion reading desk puts the document in the centre and the assistant on the right. The assistant only earns its place if it knows what the reader is looking at, which means the selection has to travel with the question.

2. Method

The panel keeps one ordinary Harness session alive. Every selection becomes one user message: the quoted passage first, then the question. Nothing else is invented.

Page two - layout checks

Long lines wrap inside the page box, and the text layer keeps its spans aligned with the glyphs underneath.

- bullet one
- bullet two
- bullet three

A second page also proves the lazy renderer mounts pages that start off-screen, and that the page counter stays honest.
